What We Know About Feeding Corn DDGS to Swine

Dr. Jerry Shurson
Department of Animal Science
University of Minnesota
Production, Use, and Nutritional Characteristics of DDGS
What is DDGS?

- By-product of the dry-grind ethanol industry
- Nutrient composition is different depending on the process
  - DDGS – dry-grind fuel ethanol
  - DDGS - whiskey distilleries
  - Corn gluten feed – wet mill
  - Corn gluten meal – wet mill
  - Brewer’s dried grains – beer manufacturing
- Nutrient content is different depending on the grain source
  - Corn DDGS - Midwestern US
  - Wheat DDGS – Canada
  - Sorghum (milo) DDGS - Great Plains US
  - Corn-sorghum and corn-wheat blends

Quick Calculation of Feed Cost Savings

Thumb rule:

Additions/1000 lb diet

+ 100 lbs DDGS \( \times \) ______ $/lb = $_______  
+ 1.5 lbs limestone \( \times \) ______ $/lb = $_______  
TOTAL ADDITIONS (A) $_______

Subtractions/1000 kg diet

- 88.5 lbs corn \( \times \) ______ $/lb = $_______  
- 10 lbs SBM (44%) \( \times \) ______ $/lb = $_______  
- 3 lbs dical. phos. \( \times \) ______ $/lb = $_______  
TOTAL SUBTRACTIONS (S) $_______

(S – A) = Feed cost savings/ton by adding 10% DDGS to the diet
USDA historical wholesale prices for DDGS ($/short ton) compared to monthly average closing prices of near-month corn and soybean meal futures from the CBT.
Issues/Barriers Limiting DDGS Use in Swine Diets
Current Commercial Dietary DDGS Inclusion Rates and Estimated Usage

- Grower-finisher diets ~85-90%
  - 10-20% dietary inclusion rates

- Sow diets ~5-10%
  - Gestation - up to 30% dietary inclusion
  - Lactation - 5-10% of the diet

- Late nursery diets < 5%
  - Added at 5-10% of the diet
Maximum Inclusion Rates of High Quality DDGS in Swine Diets
(Based Upon University of Minnesota Performance Trials)

- Nursery pigs (> 15 lbs)
  - Up to 25%

- Grow-finish pigs
  - Up to 30% (higher levels may reduce pork fat quality)

- Gestating sows
  - Up to 50%

- Lactating sows
  - Up to 30%

Assumptions: no mycotoxins
formulate on a digestible amino acid and available phosphorus basis
DDGS Issues/Challenges

1. By-product variability
   a. nutrient content
   b. nutrient digestibility
   c. physical characteristics

2. Determining the feeding value of new corn distiller’s by-products

3. Ability to pellet DDGS diets

4. Lack of a quality grading system
   a. difficult sourcing to obtain desired quality and price

5. Lack of standardized testing procedures

6. Need for quality management and certification

7. Need a high degree of
   a. research
   b. education
   c. technical support

8. Risk of mycotoxins

9. Presence of antimicrobial residues?

</table>
Product Flowability

- Particle size is sometimes too fine
- Difficult and costly to pellet
- Minimal cooling or “curing” time before loading
  - Extensive damage to trucks and rail cars
Some of the Nutrient Variability is Due to the Use of Different Approved Laboratory Testing Procedures
Variability of Moisture Content from One DDGS Source Using Approved AOAC Lab Procedures

</tbody>
</table>
Need for Quality Management and Certification

- Paradigm shift is beginning to occur
  - improved DDGS quality and consistency
  - Implementation of DDGS Quality Assurance Programs
  - Many commercial feed mills are ISO 9000:2001 and HAACP Certified
  - EU – International Feed Ingredient Standard
    - GMP Certification
  - transparency of information
  - aggressive sampling and nutrient analysis
Lysine Monitoring
Big River Resources 1/11/05 – 3/6/06
(100% DM Basis)
Antimicrobial Use In Ethanol Production

- Used to control bacterial (lactobacillus) contamination

- Can increase ethanol yield by as much as 25%

- Which ones are used?
  - Virginiamycin (0.25 to 2.0 ppm)
  - Penicillin (1 g/1000 liters)
  - Unique compared to forms used in animal feeds
Antimicrobials in Ethanol Production

- **Virginiamycin**
  - Is destroyed at temperatures > 93°C
  - Dryer temperatures range from 93 to 232°C
  - There are no detectable residues in DDGS

- **Penicillin**
  - Easily inactivated by primary alcohols and some sugars
  - Completely degraded at pH 3 and a temperature of 37°C for 30 minutes
  - There are no residues in DDGS
Mycotoxins

- Risk of mycotoxin contamination in DDGS is low
  - Poor quality corn = poor ethanol yields
  - Corn supplied to ethanol plants is generally produced locally
  - Corn produced in upper Midwest is has a low risk for mycotoxins
  - Most ethanol plants monitor for mycotoxins of incoming corn

- Must use thin layer chromatography (TLC) or HPLC for testing mycotoxins in DDGS
  - ELISA and other methods result in false positives
Other Barriers Limiting DDGS Use in Swine Diets

- Understanding and managing impact on pork fat quality

- Inconsistent feed intake responses with increasing levels of DDGS in the diet

- *In vitro* procedures to estimate amino acid digestibility among DDGS sources
  - Fast
  - Accurate
  - Inexpensive

- Net energy values of DDGS sources need to be determined

Study 2 – U of M/Land O’ Lakes Field Trial
U of M/Land O’ Lakes
Pork Fat Quality Field Study (2006)

● **Facilities**
  ● Two commercial 1000 head finishing barns in southern MN
  ● Separate sites, two independent producers
  ● Each barn had 40 pens, double sided curtain
    ● buildings with 8' pits
    ● pit fans for ventilation
    ● weighted baffle ceiling air inlets

● **Genetics**
  ● Monsanto Genepacker sows
  ● Monsanto EB terminal semen
Nutrition

- Provided by Land O’ Lakes
- Producer A fed typical corn-soybean meal diets
- Producer B fed corn-soybean meal diets containing 10% DDGS
- 7-phase mixed sex feeding program
- Last finisher diet contained 4.5g Paylean
- Diets contained similar nutrient levels with and without 10% DDGS
- All diets contained choice white grease as the supplemental fat source (1.25 to 3.75%).
Growth Performance of Grow-Finish Pigs Fed 0 or 10% DDGS Diets (UM/LOL Field Trial)

*a Linear effect of DDGS level
Data from 64 pens, 16 pens/treatment (Xu et al., 2007)
Adding Increasing Levels of DDGS to G-F Diets Slightly Reduces Carcass Yield

Xu et al. (2007)
Linear effect (P < 0.01)
Effects of Dietary DDGS Level on Last Rib Backfat

Xu et al. (2007)
30% DDGS tended to be lower than 0% DDGS (P = 0.09)
Effects of Dietary DDGS Level on % Carcass Lean

Xu et al. (2007)
30% DDGS tended to be higher than 0% DDGS (P = 0.11)
Effects of Increasing Dietary DDGS Level on Loin Characteristics

- **No difference in:**
  - ultimate pH
  - subjective color score
  - drip loss on day 0, 14, 21, or 28 post-harvest
  - lipid oxidation in loins at 28 days of shelf storage

- Loin firmness was linearly reduced
  - Due to reduced marbling
  - **Within accepted NPPC quality standards**

- Marbling was linearly reduced
  - Due to trend for reduced backfat
  - **Within accepted NPPC quality standards**

- Pigs fed the 30% DDGS diets had loins that were slightly less red
  - **Within accepted NPPC quality standards**
Effects of Increasing Dietary DDGS Level on Eating Characteristics of Pork Loins (Consumer Taste Panel)

- No difference in:
  - Cooking loss
  - Flavor
  - Off flavor
  - Tenderness
  - Juiciness
  - Overall eating quality
Adding Increasing Levels of DDGS to G-F Diets Linearly Reduces Belly Firmness

Effects of Dietary DDGS Level on Belly Firmness

Xu et al. (2007)
Effects of Increasing Dietary DDGS Level on Belly and Backfat Characteristics

- No effect on belly thickness
- No differences in belly fat color
  - Japanese color score
  - Minolta L*, a*, b*
- Backfat was slightly darker (lower L*) for pigs fed the 20% and 30% DDGS diets
- No differences in backfat color
  - Japanese color score
  - Minolta a*, b*
Take Home Messages

- Diets containing 10% DDGS will provide the same ADG as pigs fed typical corn-SBM diets
  - Diets formulated on a total lysine basis
  - Diets formulated on a digestible amino acid basis

- If >10% DDGS is added to G-F diets, diets should be formulated on a digestible amino acid basis to achieve good performance.

- Feed intake may decline with increasing levels of DDGS in the diet
  - Unclear why different studies show different feed intake responses
  - Diets containing >10% DDGS may result in improved feed efficiency
Take Home Messages

- Carcass yield is slightly linearly reduced with increasing dietary DDGS levels
  - No difference in % lean
  - No difference in backfat
  - May be due to increased viscera weight from increased dietary fiber?

- Backfat thickness is unaffected, and may be slightly reduced, with increasing dietary levels of DDGS

- Bellies will be less firm as higher dietary levels of DDGS are fed

- Belly thickness may or may not be affected by increasing dietary DDGS levels

- No concern about reduced shelf life and fat oxidation in loins under typical retail storage conditions for at least 28 days.

- Muscle quality and eating characteristics are generally unaffected by feeding diets containing increasing levels of DDGS
Effect of Feeding Diets Containing DDGS on Feed Intake of Growing Pigs (Published)

- **No Effect**

- **Decrease**
