NDF
As effective as Alfalfa haylage
Only 68% as effective as Corn silage
Handling that causes particle separation will result in considerable variation of DDG or DDGS composition.  

Akayezu et al., 1998

Fine particles (< 1 mm) represented 58% of the sample weight on average across 8 ethanol production facilities (CV 20.6%).  

Harty et al., 1998

---

**Amino Acid Profile**

![Bar chart showing the amino acid profile from 1993, 1996, and 2003]
When ADIN > 13% N lightness correlated with ADIN and IARUP.

Owen and Larson, 1991
(Ammoniated corn silage 50% diet DM)
Owen and Larson, 1991
(Ammoniated corn silage 50% diet DM)

Grings et al., 1992
(Alfalfa 39% diet DM)
Recommendations

- Research suggests DDGS can comprise between 20% and 26% of the diet DM
  - Limiting factors: CP, RUP and lysine content
    - Balance for RUP, RDP, CP and lysine
    - Limit CP coming from corn sources to less than 60% of total CP
      - Corn grain, silage, DDGS, gluten meal, gluten feed
- DDGS replaces forage NDF at 66% effectiveness
  - For every 1 lb forage replaced, use 1.5 lb NDF from DDGS
DDGS Research in Ruminants

- **NCR-88 Beef Growing-Finishing Systems**
  - Summarized studies in 1984 (NCR No. 297)
    - **Characterization of fermentation by-products**
      - Higher protein concentration than corn
      - Similar or greater RUP
      - Similar energy concentration as corn
    - **DDGS as a protein source**
      - Replacement for other protein sources
        - When combined with urea of equal value as SBM
      - As a bypass source
        - Fortified with urea > urea alone
        - More efficient protein source when combined with urea than SBM
    - **DDGS as an energy source**
      - “if abundant supplies of wet distillers’ grains should become available—as a result, for example, of increased production of fuel alcohol—this by-product could be used as an energy source in livestock feeds.”

Beef Feedlot Research

- **Focus of most of the DDGS and WDGS work**
  - No complications with composition of gain
  - Typically require lower fiber and CP concentrations
- **Variable**
  - Crude protein sources
  - Crude protein concentrations
  - Age and/or weight at feedlot entry
Research

- Data from studies conducted since 1990
- 264 pens housing 1,541 head of cattle
- 796 lb (361 kg) initial weight
- NE, IA, KS, SD

![Graph showing the impact of DDGS on ADG (Average Daily Gain)]
DDGS and CP on DMI

DDGS and CP on FTG
Recommendations

- Feed between 25% and 30% DDGS for enhanced gain
- Intake response is linear, and greater at lower dietary CP
- Feed 10% DDGS for enhanced feed conversion
- Feed conversion response is greater at lower dietary CP
