Growth in Renewable Fuels and Effects on Feeds Markets

Douglas G. Tiffany Department of Applied Economics University of Minnesota

Minnesota Nutrition Conference September 20, 2005

Topics to be Discussed

- Status of U.S. Ethanol & Biodiesel Production
- Key features of Energy Bill Affecting Feed Markets
 - Implications for Ethanol Production
 - Implications for Biodiesel Production
- Review USDA Analysis of Energy Bill
- Review Ethanol Economic Sensitivity
- Review Biodiesel Economic Sensitivity
- Consider Domestic Livestock Consuming Populations
- Consider Prevailing and Projected Energy Prices----
- Consider Firm Responses
- Implications for the Feed Business---Bonanza or Hardship

Status: U.S. Ethanol & Biodiesel Production

- Ethanol's capacity continues to grow rapidly. (Approx. 4 Bill. Gallons in 2005 or 3% of U.S. gasoline supply.)
- Ethanol plants have been quite profitable in recent years, but returns can be volatile.
- Biodiesel is experiencing growth; but it starts from a much lower level. (25 million gallons in 2004)
- Biodiesel can never comprise as high a share of distillate supply due to limited feedstock supplies.
- Dominant feedstock is soybean oil, although recycled oils can be used.
- Ethanol and biodiesel receive substantial subsidies.

Key Features of Energy Bill

- Boosts production of ethanol & biodiesel in several ways
- Corn-based ethanol will dominate.
- Reformulated Gasoline Standards will be removed to allow more flexibility to marketers of gasoline.
- "Renewable Fuel Standard" Credits will be established and traded.
- Cellulosic ethanol is encouraged.

Annual Production Targets for Renewable Fuels

- 2006
- 2007
- 2008
- 2009
- 2010
- 2011
- 2012

- 4.0 Billion Gal.
- 4.7 Billion Gal.
- 5.4 Billion Gal.
- 6.1 Billion Gal.
- 6.8 Billion Gal.
- 7.4 Billion Gal.
- 7.5 Billion Gal.

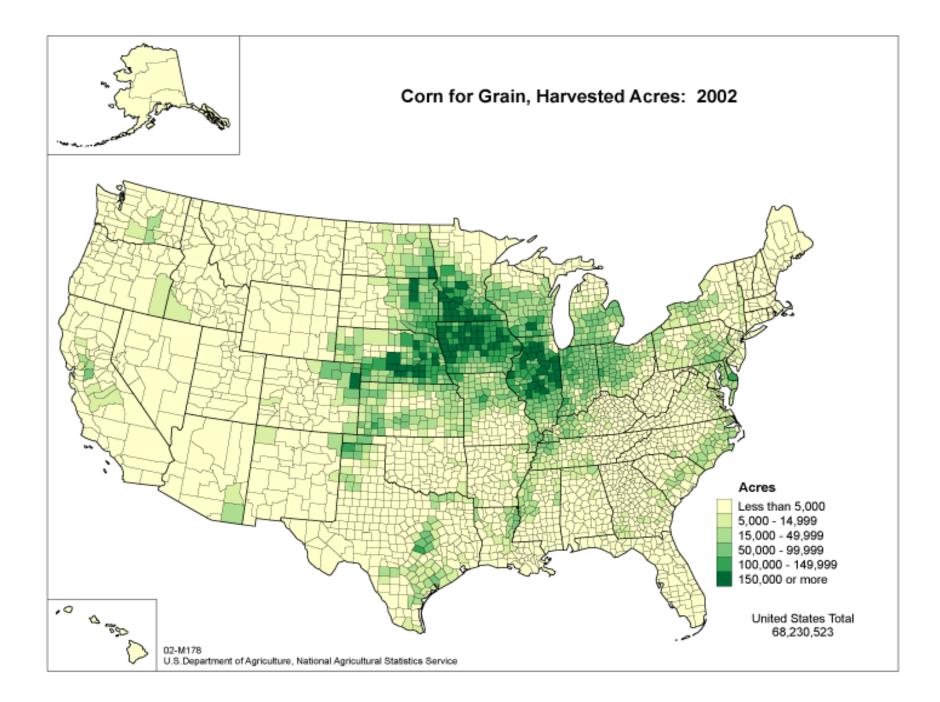

Do we have enough corn to supply the expanding ethanol industry?

	Ethanol	Corn Use	Corn	% Corn
Year	Prod.	For Ethanol	<u>Crop*</u>	<u>Crop</u>
	(Bil.Gal)	(Mil. Bu.)	(Mil. Bu.))
03/04	3.4	1,259	10,089	10
04/05	3.7	1,370	11,741	12
05/06	4.0	1,482	10,985	13
06/07	6.0	2,222	10,850	20

- Will need to increase corn acres by shifting land from soybeans or from CRP. Each billion gallons requires about 370 million bushels, or 2.5 to 3 million acres of corn. We may need to shift acres from soybeans and CRP.
- * USDA estimates.

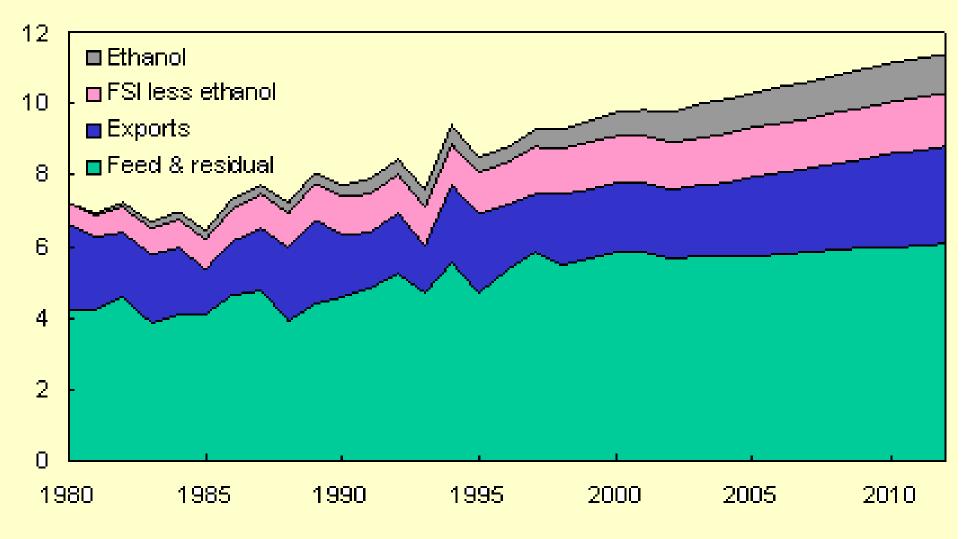

USDA Analysis of Energy Bill through 2012

- Additional ethanol will primarily be derived from corn at drygrind facilities.
- Corn prices will increase 8% (\$.30 per bushel) increase in U.S. by 2012.
- Ample DDGS supplies will reduce prices of SBM 7%.
- Demand to make biodiesel will raise soy oil price 6%.
- Corn acres will rise 3.5%.
- Soybean acres will rise 3%.
- Broiler and turkey production will expand due cheaper SBM.
- Production of <u>all other livestock</u> will decline due to higher corn prices.
- Expect biomass ethanol and biodiesel to be more important after 2012.

U.S. corn use

Billion bushels

Economics, U of MN

Ethanol Production

Historic U.S Production 1980-2004 with Projections for 2005-06

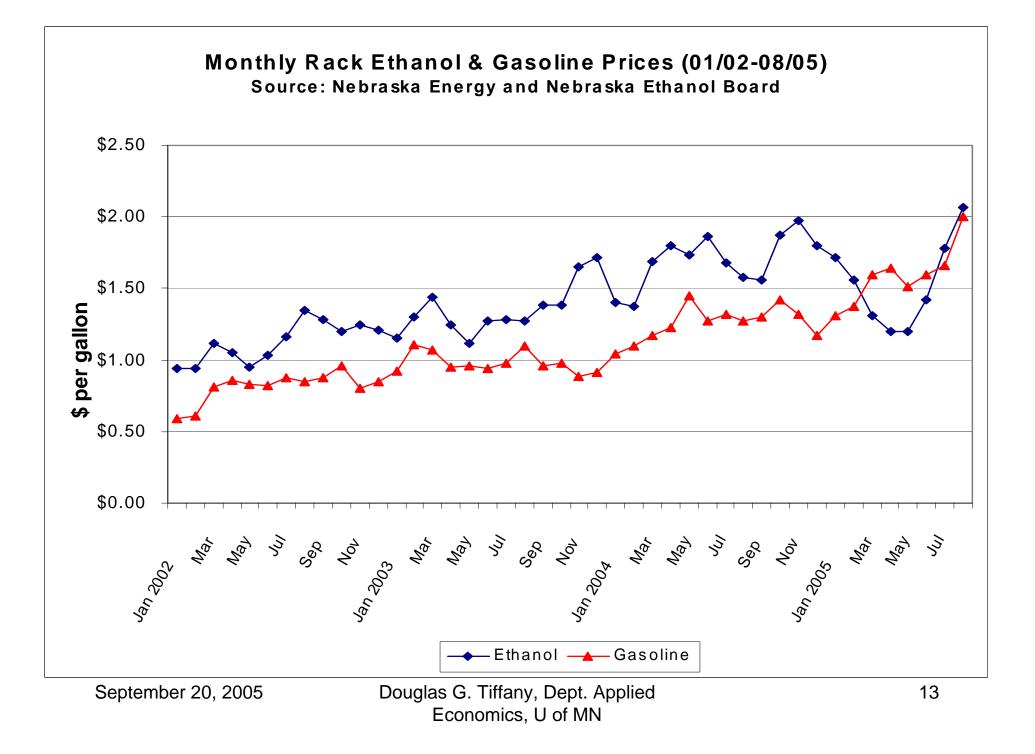

Economics, U of MN

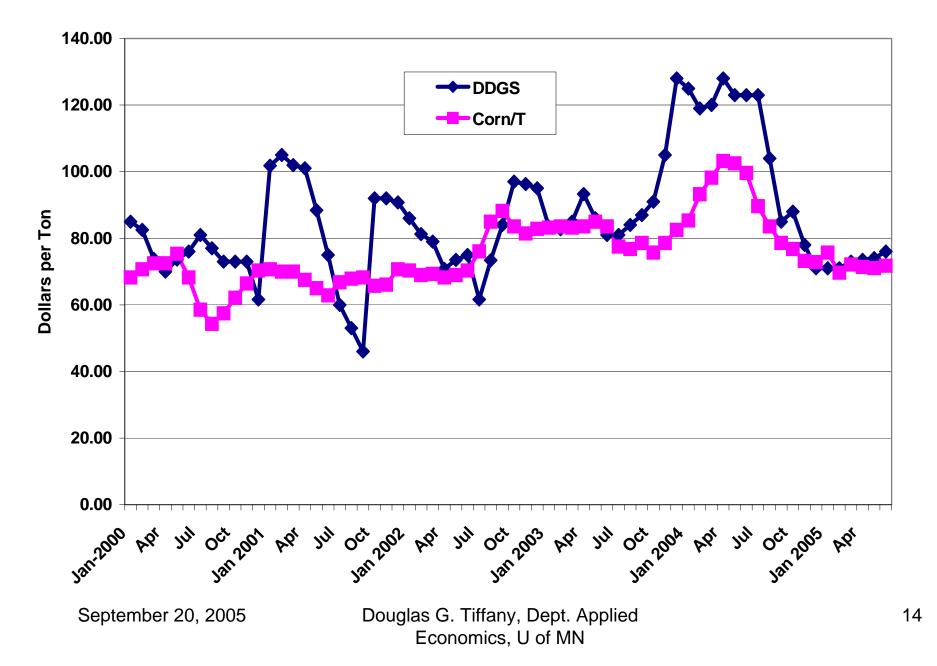

Four Market Segments	Million	
For Ethanol in 2004.	<u>Gallons</u>	%
 Oxy-fuel program 	290	8
 Reformulated Gasoline 	1,950	55
Octane booster & blending	1,050	29
 State Mandate (MN) 	280	8
Total	3,570	100

U.S. produced 3.41 and imported 0.17 . The total is up from 2.8 in 2003. Domestic production for 2005 should be close to domestic use. September 20, 2005 Douglas G. Tiffany, Dept. Applied

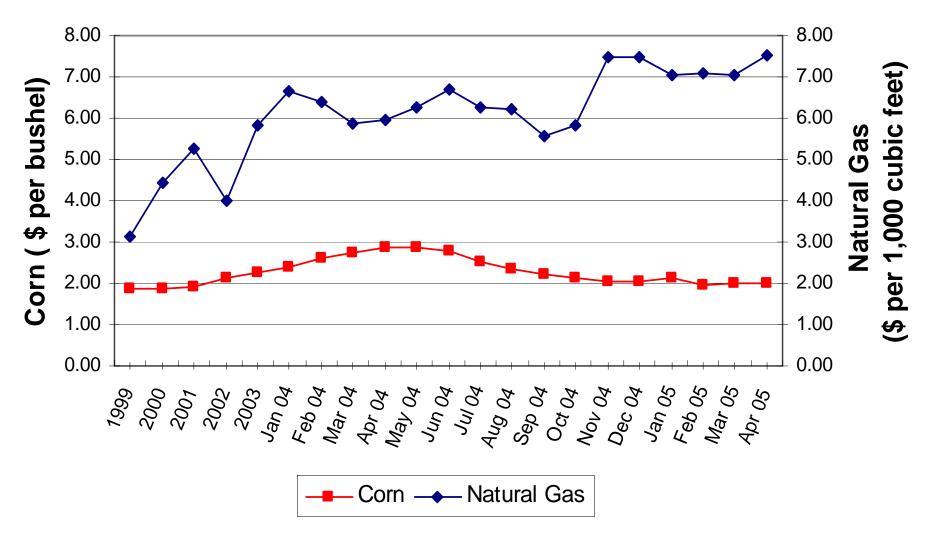

Economics, U of MN

2003 Project Goals & Methods (Tiffany and Eidman)

- Goal: Describe and Quantify Factors of Success
 in Dry-Grind Ethanol Production
- Steps in Research
 - Conduct Interviews of Plant Personnel & Bankers—to Learn Factor Inputs, etc.
 - Develop Spreadsheets to Measure Plant Profits
 - Interpret Results
 - Advise Farmers/Investors, Bankers
 Policymakers

63 Ethanol Plant Profits for Shareholders and Princip						

September 20, 2005

Douglas G. Tiffany, Dept. Applied Economics, U of MN

Review Ethanol Economic Sensitivity

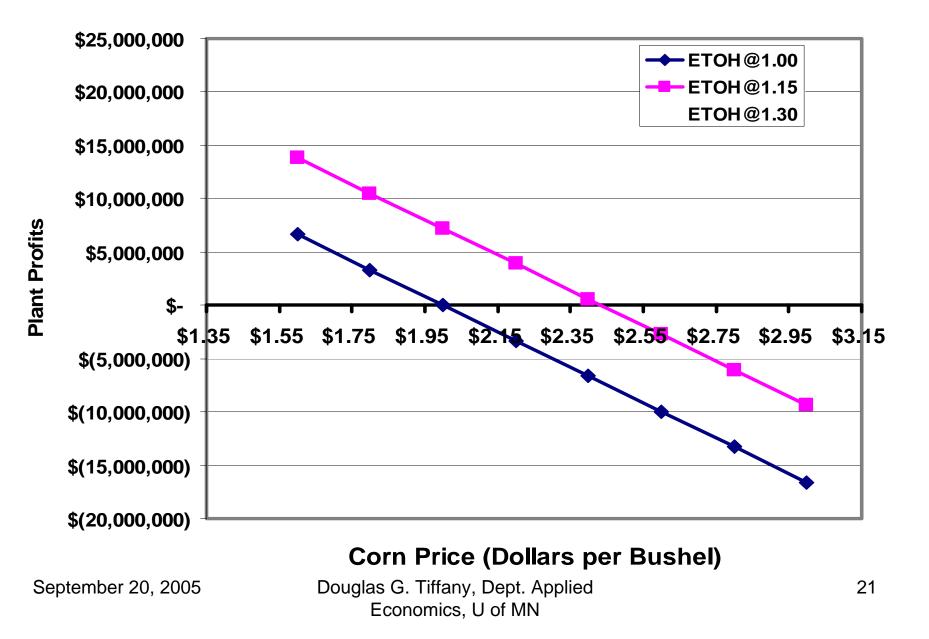

- Key factors affecting profits
 - Ethanol price
 - Corn price
 - Natural gas price
 - DDGS prices
 - Wet vs. Dry Distillers Grains Products
- Sensitivity of individual and multiple factors

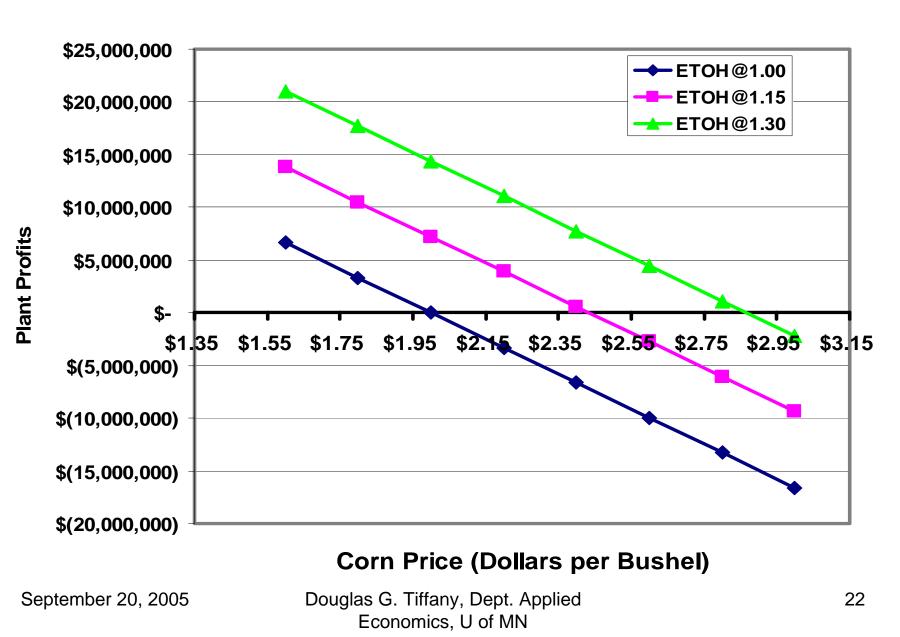

Economics, U of MN

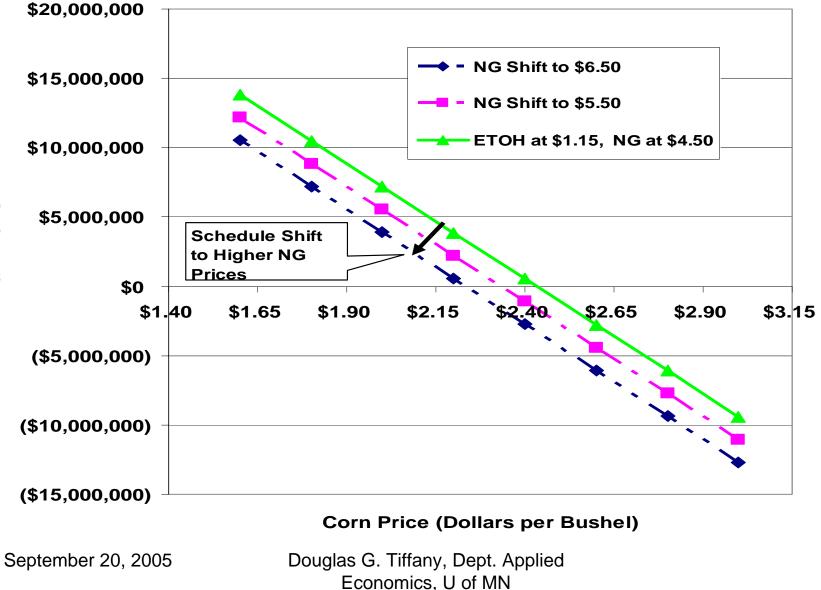

Net Margins of 40 MM Gal./Yr. Dry-Grind Plant for **Corn Price-Ethanol Price Combinations**

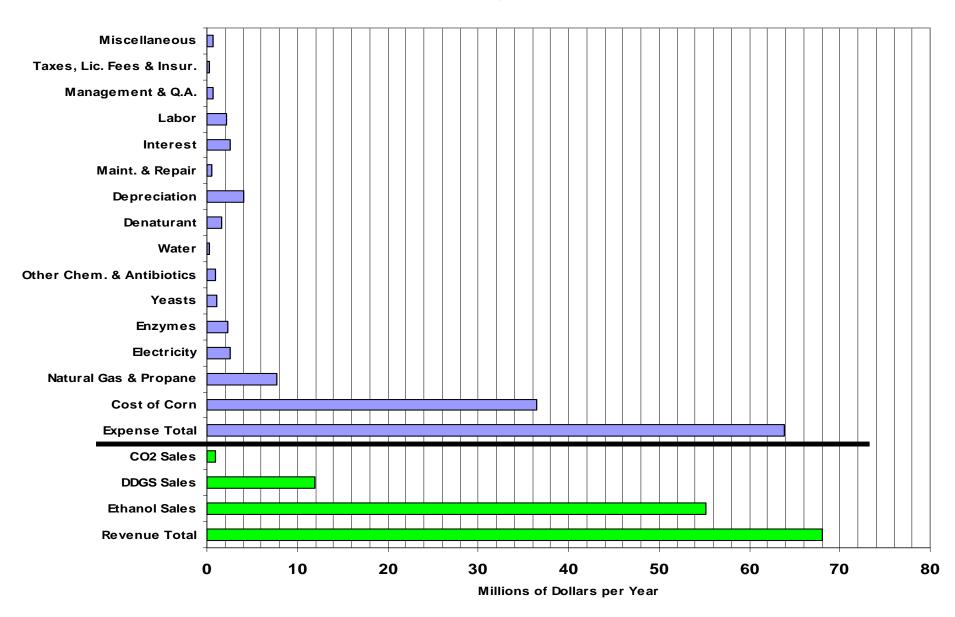

Net Margins of 40 MM Gal./Yr. Dry-Grind Plant for Corn Price-Ethanol Price Combinations Dry-Grind Net Margins for Various Corn Prices Shift as Natural Gas Rises to \$5.50, \$6.50 from \$4.50 per Dekatherm; Ethanol @ \$1.15/Gal.

23

Revenues and Expenses for 40MM Dry Mill Plant at Baseline Conditions

September 20, 2005

Douglas G. Tiffany, Dept. Applied Economics, U of MN 24

Typical Dry Grind Revenue Categories (5 yr.)*

 Ethanol Sales 	80%
 DDGS Sales 	19%
• <u>CO2</u>	1%
 Total 	100%

Five Key Factors & Baseline Levels

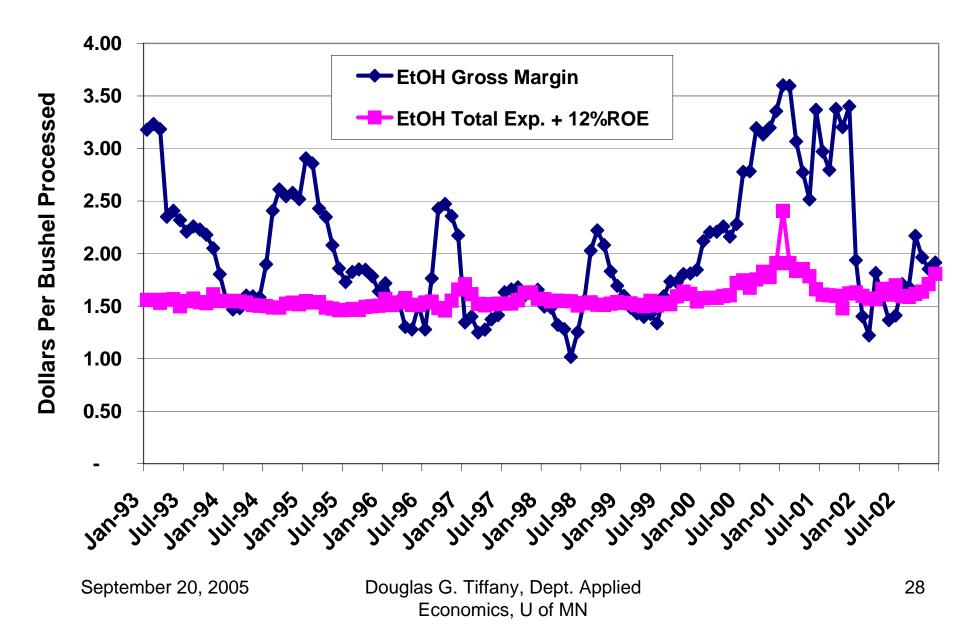

- Corn Price---- \$2.20 per bushel
- Ethanol Price---- \$1.15 per gallon
- Nat. Gas Price----\$4.50
 per dekatherm
- Ethanol Yield---- 2.75 gal.(anhyd)/bushel
- Capacity Factor of Nameplate----1.20

Conclusions: Sensitivities

- Favorable economics with low corn prices, high gasoline prices, low natural gas prices, low interest rates.
- From Baseline Conditions:
 - -Corn Price--- Zero profits above \$2.43 per bu.
 - -Ethanol Price--- @\$1.15--- profits of \$.15/ bu., @\$1.35--- profits of \$.56/ bu.
 - -Natural Gas Price rise to (\$6.85) from baseline levels of \$4.50/ dekatherm wipes-out profits.
- Ethanol Yield per Bushel —very important
 - 2.75 gal./bu (typical today)
 - 2.36 gal./bu--- wipes out profits at baseline

Retrospective Ethanol Gross Margins, Operating Expenses plus 12% ROE of 40MM Dry Mill Plant from 1/93-12/02

Fractionation for Dry-Mills

- Quick-Germ Technology
 uses more enzymes, depends on favorable sale of corn oil (Univ. of Illinois)
- Quick-Fiber Technology—offers opportunity for greater through-put, but altered DDGS product characteristics (Univ. of Illinois)
- Others--- Some more mechanical, others more enzymatic in separation
 - Frazier, Barnes
 - FWS
 - GrainValue
 - Etc.

Utilization of DDGS as Fuel (Morey, Tiffany, Hatfield)

Est. Annual Energy Cost/Savings for 40 MM Gal. Ethanol Plant (\$MM)

	DDGS @	<u>\$73 per t</u>	on	
Natural Gas Price			СНР	CHP
(\$/MM Btu)	Proc. Heat	CHP	\$.03/ KWH	\$.045/KWH
\$5.28	1.7	3.1	5.0	6.9
\$6.33	3.3	4.8	6.6	8.6
\$7.39	4.9	6.4	8.2	10.2
\$8.44	6.5	8.0	9.9	11.8
\$9.50	8.2	9.6	11.5	13.4

September 20, 2005

Douglas G. Tiffany, Dept. Applied Economics, U of MN

Current Firm Responses

- Ethanol Plants replacing NG with Coal
- Ethanol Plants replacing NG with DDGS and other Biomass
- DDGS are produced at dry-grind ethanol plants in amounts sufficient to provide process heat, electricity in co-generation, and electricity to sell on grid.
- Ethanol Plants switching from DDGS to WDGS

20,000,000 18,000,000 16,000,000 14,000,000 12,000,000 Tons of DDGS 10,000,000 8,000,000 6,000,000 4,000,000 2,000,000 0 2003 2004 2005 2006 2007 2008 2009 2010 2011 2012 2013 32 September 20, 2005 Douglas G. Tiffany, Dept. Applied

Projected DDGS Available in U.S. for Feeding or Burning 2004-2012, **Assuming Steady Exports**

Economics, U of MN

Implications of Greater Supplies of Distillers Byproducts

- Need improvements in DDGS attributes
 - Standardize DDGS grades based on nutrient content, amino acid digestibility, particle size and bulk density.
 - Improve flowability to reduce caking
- Greater utilization of WDDG by Beef and Dairy
- Utilization of DDGS as biomass fuel in the plant
 - Can provide process heat, on-site electricity, electricity to sell
 - Remarkable to have biomass fuel arrive at plant in proportion to requirements
- Fractionation technologies enhance economics by
 - Increasing throughput
 - Decreasing process heat and enzyme costs
 - Improving portfolio of products

Ethanol Summary

- Ethanol production has been profitable, but it will soon face disruption of traditional markets as oxygenate in mandated markets.
- Usage of ethanol by petroleum marketers is hindered by
 - Technical issues at refineries in removing more volatile fractions
 - Inability to utilize pipelines to transport ethnaol
- Ethanol Markets will witness
 - increased use of ethanol as a fuel extender
 - -increased use of ethanol as an octane booster
 - the closing of older and smaller ethanol plants
- Ethanol plants are
 - turning to coal and biomass in response to high NG Prices
 - seeking more opportunities to feed WDDG products
 - Investigating fractionation technologies to increase capacity, diversity their portfolio of byproducts, and segregate less valuable fractions for use as fuel.

September 20, 2005

Markets for Biodiesel

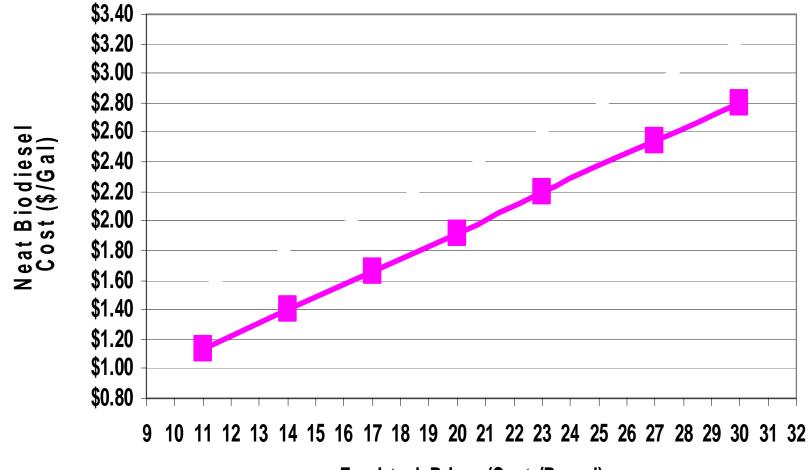

Biodiesel Economic Sensitivity

- Smaller Market than Ethanol
- Diesel Usage in the U.S. approx. 1/3 of Gasoline
- MN Per Capita Usage
 - 500 gal. of Gasoline, 160 gal. of Diesel
- Biodiesel has been more Costly than Petro-Diesel
- Excellent Fuel w/low Emissions; Usually Blended
- Low Blends Enhance Lubricity in Low-sulfur Diesel Fuel
- U.S. Production Levels of Biodiesel at 30 MM gal. in 2005 vs 450 MM gal. in Europe
- Niche Markets to Reduce Emissions—mines, buses

Production Economics of Biodiesel

- Highly dependent on cost of feedstock, whether vegetable oils such as rapeseed oil, soybean oil, sunflower oil, yellow grease, or animal fats.
- Haas, et al. estimate soy oil is 86% of cost
- Other ingredients used----
 - methanol (made from Natural Gas)
 - Catalysts such as KOH and NaOH
- Crude glycerol is a by-product

Biodiesel Costs from 10 Million Gallon Plant Feedstock Prices & 15% ROR (Tyson, NREL)

Feedstock Prices (Cents/Pound)

September 20, 2005

Douglas G. Tiffany, Dept. Applied Economics, U of MN 38

Potential Biodiesel Production:

- If all U.S. fat and oil feedstocks were processed for biodiesel 13.3% of U.S. diesel supply could be replaced.--- (Duffield et al.)
- Minnesota could produce 47% of its diesel requirement if all soybeans produced in the state were crushed and the oil used for biodiesel.

U.S. Feedstocks for Biodiesel (Eidman)

- Vegetable Sources
- Soy Oil 18,309 MM lb 2,378 MM gal.
- Corn Oil 2,436 MM lb 316 MM gal.
- Oth. Crop 1,691 MM lb
- Subtotal 22,436 MM lb. 2,965 MM gal.

271 MM gal.

U.S. Biodiesel Feedstocks (cont.)

Recycled and Animal Sources

 Yellow Grease 	2,656 MM lb.	345 MM gal.
Lard	1,090 MM lb	142 MM gal.
 Edible Tallow 	1,894 MM lb	246 MM gal.
Inedible Tallow	<u>3,696 MM lb.</u>	<u>480 MM gal.</u>
 Subtotal 	9,336 MM lb.	1,213 MM gal.

• Total Supply 32,173 MM lb. 4,178 MM gal.

U.S. Biodiesel Market: How Big? How Fast?

- 30 Million Gal. of B100 sold in U.S. 2004 with support from Bioenergy Credit.
- On Sept. 29, Minnesota Biodiesel Mandate starts.
- In mid-2006 "lubricity" market kicks-in.
 - -1% blend would require 470 MM gal. in 2010

-1% 630 MM gal. in 2020

Conclusions: Biodiesel

- Biodiesel Production in the U.S. has been slow compared to Europe.
- Capacity is apparently in place for considerable production; however, infrastructure to blend may be lacking.
- Biodiesel Tax Credit Should keep biodiesel price nearly equal to petro-diesel
- Niche markets will be important, such as school transit buses, and heating oil
- National market will be to serve as lubricity agent in Ultra Low Sulfur Diesel Fuel
- Lacking Biodiesel Tax Credit, yellow grease will be competitive with Soy Oil
- Tallow and Lard may be bid away from uses in feeding, which have been diminishing due to BSE and other animal health issues.

If my projections are wrong, check with my Complaint Department next year at this meeting.
